                                          The invention relates to preventives and remedies for pulmonary hypertension, comprising an antegonistic inhibitory mutant of monocyte chemoattractant protein-1 (MCP-1), DNA encoding the mutant MCP-1, or a neutralising antibody against MCP-1. MCP-1 is a member of the C-C chemokine family. The preventives and remedies have hypotensive activity and can be used in the prevention and treatment of pulmonary hypertension particularly pulmonary primary hypertension. The present sequence represents DNA encoding wild-type human MCP-1.

The method comprises preventing arteriosclerosis or endothelial thickening in blood vessel autograft or allograft, post-transplant, using an agent which inhibits the function of monocyte chemotactic protein ! (MCP-1). The present sequence was used to illustrate the method of the invention

ö The invention relates to an isolated polynucleotide (I) comprising: (a) any of a group of over 4000 nucleotide sequences (ABV94628-ABV99145); (b) complements of (a); (d) sequences consisting of at least 20 contiguous residues of (a); (d) sequences that hybridize to (a), under moderately stringent conditions; (e) sequences having at least 75% or 90% identity to (a); or (f) degenerate variants of (a). Polypeptides (ABP66596-ABP66637) encoded by (I) and oligonucleotide can be used to detect cancer in a patient and compositions comprising polypeptides, polynucleotides, antibodies, fusion proteins, T cell populations and antigen presenting cells expressing the polypeptide are useful in treating pancreatic cancer 129 120 190 GTGATCTTCAAGACCATTGTGGCCAAGGAGATCTGTGCTGACCCCCAAGCAGAAGTGGGTT 249 130 TCAGTGCAGAGGCTCGCGAGCTATAGAAGAATCACCAGCAGCAAGTGTCCCAAAGAAGCT 189 GTGATCTTCAAGACCATTGTGGCCAAGGAGATCTGTGCTGACCCCAAGCAGAGTGGGTT 180 9 New isolated polynucleotide and pancreatic tumor polypeptides, useful f diagnosing, preventing and/or treating cancer, particularly pancreatic CAGCCAGATGCAATCAATGCCCCCAGTCACCTGCTGTTATAACTTCACCAATAGGAAGATC 70 cadecadardeaardaccecadreacerdergranaacrreaceaaragaare TCAGTGCAGAGGCTCGCGAGCTATAGAAGAATCACCAGCAGCAAGAAGTGTCCCAAAGAAGCT Gaps Jiang Y; therapy; vaccine; immunostimulant; · 0 228 Claim 1; SEQ ID NO 3105; 300pp + Sequence Listing; English. ö
and stimulating an immune response. The polynucleotides can be used as probes or primers for nucleic acid hybridisation, in the design and preparation of ribozyme molecules for inhibiting expression of the tumour polypeptides and proteins in the tumour cells, in vaccines and for gene therapy. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                          345

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a composition comprising a positively or neutrally charged phosphoramidite. The composition is useful for separation of nucleic acid molecules. The composition is further useful for fractionation of specific nucleic acids by selective charge reversal useful in e.g. INVADER assay cleavage reactions; and in the synthesis of charge-balanced molecules. In the fractionation of nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                284 GTGATCTTCAAGACCATTGTGGCCAAGGAGATCTGTGCTGACCTGACCCAAGCAGAAGTGGGTT

molecules, the method provides an absolute readout of the partition of products from substrates (i.e. provides a 100% separation). Through the use of multiple positively charged adducts, synthetic molecules can be constructed with sufficient modification due to the fact that the normally negatively charged strand is made nearly neutral. It is also possible to distinguish between a enzymatically or thermally degraded DNA fragments due to the absence or presence of 3'phosphate. ABS60740-ABS60813 represent coding sequences and primers used in the method of the

                                                                                                                                                                                                                                                                   ö
                                                             The present sequence encodes monocyte chemoattractant protein-1. The efficacy of a vaccine is enhanced by combining it with one or more chemokines. This can be used to enhance humoral or cell-inediated immune response. The purified nucleotide sequence encoding the chemokine, fragments, derivatives, analogues, or truncation isoforms are expressed in a coordinated manner upon introduction in a suitable cell. These sequence are operably linked to one or more gene regulatory elements. The nucleic acid may have deletional, insertional, or substitutional mutations. They are referred as DNA vaccines and are administered by constructing an expression plasmid vector either directly or indirectly. The chemokine gene is isolated by PCR, which can be used to amplify the desired sequence in a genomic or cDNA library. The vaccines can be used to treat microbial diseases especially HIV
                                                                                                                                                                                                                                                                                                      123 CAGCCAGATGCAATGAATGCCCCAGTCACCTGCTGTTATAACTTCACCAATAGGAAGATC 182

                                                                                                                                                           The invention relates to a method for improving immune response to an HIV antigen. The method involves administering to the subject a composition which comprises: an isolated HIV antigen (e.g., apl20 or gp160) against which an immune response is desired in subject, chemokine, such as macrophage derived chemokine (MDC) and a carrier. The method is useful for improving subject's immune response to HIV antigen (e.g., gp120 or gp160). The invention is useful for enhancing the efficacy of immune response against the antigen in a subject. The invention is useful as

This invention relates to a novel method of characterising prostate tissue in a subject and to compositions and methods for cancer diagnostics, including cancer markers, in particular prostate cancer. Prostate cancer (PCA) is a leading cause of male cancer-related death. Additional serum and tissue blomarkers would aid diagnosis. The invention may provide means of producing compounds with a cytostatic activity or allow the development of gene therapy. The methods of the invention useful for characterising prostate tissue in a subject, screening subject, detecting AMACR (alpha-methylacyl-coenzyme A racemaes) expression in a bodily fluud, characterising the growth of cells. The diagnosing cancer in a subject and inhibiting the growth of cells. The present sequence is a DNA sequence which is preferably utilised in the
                                                           Characterizing prostate tissue comprises providing a prostate tissue sample from a subject and detecting the presence or absence of expression of hepsin, pim-1 or EZH2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             123 cagccagardcaarcaargccccagrcacrdcrdrraraacrrcaccaaraggaagarc 182

The invention relates to a method of determining whether a patient will respond to treatment with a farnesyl transferase inhibitor (FTI), by analyzing the expression of gene that is differentially modulated in the presence of an FTI. The method is useful for determining whether a patient will respond to treatment with a FTI such as (B) 6-[amino(4-chlorophenyl) (1-methyl-1H-imidazol-5-yl)methyl]-4-(3-chlorophenyl) -1-methyl-2-(IA)quinolinone, monitoring the therapy of a patient, treating a patient with leukemia with FTI if the analysis indicates that the patient will respond. This sequence corresponds to a gene whose expression may be modulated in the presence of FTI.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                120

The present sequence encodes a monocyte chemoattractant peptide (MCP) designated MCP-1. MCPs can be isolated from human glioma cell line U-105MG and peripheral blood monomuclear leukocytes. MCPs are used for the treatment of neoplasms and infections in humans. Short peptides derived from MCPs can be screened to identify those that can bind to the monocyte receptor without stimulating a chemotactic response. These are potentially useful for treating inflammation associated with monocyte
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              243 chdarchrcaagaccarhdregeccaaggachtergrerereaccccaagcagaagreedri 302
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Peptide with chemotactic activity for monocytes - from human monocytes or glioma cells, useful for treating infections and neoplasms.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Cytostatic; vasotropic; tranquiliser; antiatherosclerotic; gene therapy; antiinflammatory; vulnerary; gynecological; ophthalmological; vaccine; hypoxia; tumourigenesis; angiogenesis; apoptosis; cancer;

                                                                                                                                                                                                                                                                                                                                                                                                                      This sequence encodes a human-derived monoyte chemo-attractant peptide product (MCP-1) which exhibits optimal chemotactic activity at a conco. of 1nM and has a mol. mass of ca. 8,400 D. MCP-1 can be used for treating infection eg inflammatory disease, or for the control of neoplasms by accumulation of monocytes at the site of the infection. The DNA is obtd. by chemical synthesis, by screening reverse trascripts of mRNA from purified blood leukocytes or cell cultures of eg U-373 MG or KMG-5. (Note: Revised entry submitted to correct the patent number format of US Government-owned NTIS applications to prevent clashes with orgaing US granted patent numbers. The present invention relates to methods for identifying genes and proteins that are implicated in a specific disease or physiological condition. The method comprises comparing the transcriptome/proteome of a specialised cell type implicated in a disease or condition with that of a second specialised cell type, under two experimental conditions, and identifying a gene that is differentially regulated in the two specialised cell types under experimental conditions. ABN77873-ABN78116 and ABP65061-ABP65257 were identified using the methods of the invention. The coding sequences and proteins are useful for treating a disease in a patient, for manufacture of a medicament for treating hypoxia-regulated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         conditions, and for regulating tumourigenesis, angiogenesis, apoptobles, balological response to hypoxia conditions, or hypoxic-associated balological response to hypoxia conditions, or hypoxic-associated for monitoring the therapeutic treatment of a disease or physiological for monitoring the therapeutic treatment of a disease or physiological condition, such as cancer, ischaemic conditions, reperfusion injury, retinopathy, neonatal stress, precelapmsia atherosclerosis, inflammatory conditions, wound healing, inflammation, erythropoiesis or hair loss
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ischaemic condition, reperfusion injury, retinopathy, neonatal stress, preeclapmsia, atherosclerosis, inflammatory condition, wound healing, inflammation; erythropoiesis, hair loss, human; gene; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Identifying a gene involved in disease for treating hypoxia-regulated conditions, comprises comparing the transcriptome/proteome of two celltypes under different conditions and identifying a differentially

differentially expressed in models of osteogenesis upon being put in contact with a stimulator of osteogenesis. The present sequence is one such sequence. This sequence can be used for diagnosing osteoporosis/bone disease in a patient, promoting osteogenesis and/or preventing osteoporosis/bone disease. The present sequence encodes a secreted protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            GTGATCTTCAAGACCATTGTGGCCAAGGAGTCTGTGCTGACCCCAAGCAGAAGTGGGTT 302

New antisense oligonucleotides useful for treating e.g. pulmonary vasoconstruction, inflammation, allergies, asthma, hypertension, bronchitis, emphysema, respiratory distress syndrome, ischemia or

Disclosure; Page 761-762; 1343pp; English.

The present invention describes a new composition comprising an antisense oligonucleotide (CN) with low adenosine (up to 15%), which targets conclete acids involved in bronchoconstriction, allergies, and/or inflammation. The ON can have antiinflammatory, antiallergic, antiasthmatic, cytostatic and analgesic activities. The compositions are useful for the treatment of diseases associated with inflammation, confined airways, including lung disease and diseases whose secondary effects afflict the lungs of a subject. They can be used for treating c. impeded respirations, pulmonary vasconstriction, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, pulmonary hypertension, emphysema, chronic obstructive fibrosis, and cancers which map metastasis to the lungs, including breast and prostate cancer. The reduction of the adenosine content of the carcinomas, and cancers which may metastasis to the lungs, including breast and prostate cancer. The reduction of the adenosine content of the calease of deoxyadenosine which activates adenosine receptors causing conchoconstriction and inflammation. AAA12313 to AAA3531 represent to invention, which correspond to SEQ ID No:1 to 2815, and then the last 185 sequences are also called SEQ ID No:1 to 2815, and then the last to the previously named sequences. SEQ ID No:1 to 1680 (AAA3233 to AAA3392) are specifically claimed ONS from the present invention. N B. Sequences given in the disclosure of the present invention of ont match is the interpretation of the present invention. On the interpretation of the present invention. Batent No. 6001649

GENERAL INFORMATION:
APPLICANT: CAPUT, Daniel
APPLICANT: FERRARA, Pascual
APPLICANT: MINCUX, Brigitte
APPLICANT: WITY, Adrian
APPLICANT: VITA, Natalio
TITLE OF INVENTION: Protein having a cytokin type
TITLE OF INVENTION: protein having a cytokin type
TITLE OF INVENTION: for its preparation.
NUMBER OF SEQUENCES: 25

RESULT 14

Sequence 15, Application US/07927391

Sequence 15, Application US/07927391

Patent No. 6001649

GENERAL INFORMATION:
APPLICANT: CAPUT, Daniel
APPLICANT: MINTY, Adrian
APPLICANT: MINTY, Adrian
APPLICANT: WITA, Natalio
TITLE OF INVENTION: activity, and recombinant DNA, expression vector and hosts
TITLE OF INVENTION: activity, and recombinant DNA, expression vector and hosts
TITLE OF INVENTION: for its preparation.

NUMBER OF SEQUENCES: 25

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

```

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The library was constructed according to Bonaldo, Lennon and Soares, Genome Research, 6:791-806, 1996. First strand cDNA synthesis was primed with an oligo-dT primer containing a Not I site. Double stranded cDNA was ligated to an ECOR I
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 BM704915

Clone Distribution: Researchers may obtain clones from Research
Genetics (www.resgen.com).
Seg primer: M13 Reverse.
adaptor, digested with Not I, and cloned directionally into pT7T3-Pac vector. The oligonucleotide used to prime the synthesis of first-strand cDNA contains a library tag sequence that is located between the Not I site and the (dT)18 tail. The sequence tag for this library is ACCTA. This library was created for the program, Gene Discovery in the Visual System, supported by National Bye Institute (NEI).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 EST 28-FEB-2002

/note="Organ: eye; Vector: pT7T3-Pac (Pharmacia) with a modified polylinker; Site_lib="Enbray" containing the modified polylinker; Site_lib="Enbray" containing the UI-B-CII is a normalized cDNA library containing the following tissue(a): RPE and Choroid. The library was constructed according to Bonaldo, Lennon and Soares, Genome Research, 6:791-806, 1996. First strand cDNA synthesis was primed with an oligo-dT primer containing a Not I site. Double stranded cDNA was ligated to an EcoR I adaptor, digested with Not I, and cloned directionally into pT7T3-Pac vector. The oligonuclectide used to prime the synthesis of first-strand cDNA contains a library tag sequence that is located between the Not I site and the (dT)18 tail. The sequence tag for this library is ACCTA. This library was created for the program, Gene Discovery in the Visual System, supported by National Eye Institute (NEI)."

DXF22686E804104 r1 686 (synonym: hlcc3) Homo sapiens cDNA clone
DXF22668E804104 5', mRNA sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Ingolstaedter Landstr.1, D-85764 Neuherberg, Germany
This is the 5' sequence of the clone insert
Clone from S. Wiemann, Molecular Genome Analysis, German Cancer
Research Center (DKFZ); Email s.wiemann@dkfz- heidelberg'de;
sequenced by MediGenomix (Martinsried/Germany) within the cDNA
sequencing consortium of the German Genome Project. No s1 sequence
available.

modified polylinker; Site_1: ECOR I; Site_2: Not I; UT-E-CII is a normalized CDMA library containing the following tissue(s): RPE and Choroid. The library was constructed according to Bonaldo, Lennon and Soares, Genome Research, 6:791-806, 1996. First strand cDMA synthesis was primed with an oligo-dT primer containing a Not I site. Double stranded cDMA was ligated to an ECOR I adaptor, digested with Not I, and cloned directionally into pTTMT-pac vector. The oligonucleotide used to prime the synthesis of first-strand cDMA contains a library tag sequence that is located between the Not I site and the (dT)B tail. The sequence tag for this library is ACCTA. This library was created for the program, Gene Discovery in the Visual System, supported by National Eye Institute (NEI). TAG_TISSUE=RPE and Choroid TAG_LIB=UI-E-CI1 TAG_SEQ=ACCTA"

//ICF-EC1 is a normalized cDNA library containing the following tisus(s): Normal lung from adult and from fetal day 64, day 87, week 19 and week 42. The library was constructed according to Bonaldo, Lennon and Soares, Genome Research, 6:791-806, 1996. First strand cDNA synthesis was primed with an oligo-dT primer containing a Not I site. Double stranded cDNA was ligated to an EcoR I adaptor, digsered with Not I, and cloned directionally into pT773-Pac vector. The oligonucleotide used to prime sequence that is located between the Not I site and the (dT)18 tail. The sequence tag for this library is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              _TISSUE=Normal Lung Epithelial Cells Tissue nos 369-371

UI-CF-DU1-aav-j-23-0-UI.S2 UI-CF-DU1 Homo sapiens cDNA clone
UI-CF-DU1-aav-j-23-0-UI 3', mRNA sequence.
CDNA Library Arrayed by: Dr. M. Bento Soares, University of Iowa DNA Sequencing by: Dr. M. Bento Soares, University of Iowa Clone Distribution: Researchers may obtain clones from Research Genetics (www.resgen.com) or from Open Biosystems (www.openbiosystems.com).

The following repetitive elements were found in this cDNA Seq primer: M13 PORWARD
POLYA=Yes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            61 TCAGTGCAGAGGCTCGCGAGCTATAGAAGAATCACCAGCAGCAAGTGTCCCAAAGAAGCT 120

Bento Soares, University of Iowa CDNA Library preparation: Dr. M. Bento Soares, University of Iowa DNA Sequencing by: Dr. M. Bento Soares, University of Iowa Clone Distribution: Clone distribution information can be obtained from Dr. M. Bento Soares, bento-soaresculowa.edu The following repetitive elements were found in this CDNA sequence: 1-39, AT rich#Low_complexity (matched compliment) POLYA=Yes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    constructed according to Bonda, lennon and Soares, Genome Research, 6:791-806, 1996. First strand cDNA synthesis was primed with an oligo-dT primer containing a Not I site. Double stranded cDNA was ligated to an EcoR I adaptor, digested with Not I, and cloned directionally into pT773-Pac vector. The oligonucleotide used to prime the synthesis of first-strand cDNA contains a library tag sequence that is located between the Not I site and the (dT)18 tail. The sequence tag for this library is
                                                                                        BOS73817 644 bp mRNA linear EST 19-JUN-2002 UI-H-EZO-bax-c-19-0-UI.sl NCI_CGAP_Chl Homo sapiens cDNA clone UI-H-EZO-bax-c-19-0-UI 3', mRNA sequence.
